

Stock Market Reaction to Female CEO Appointments: Is the Market Gendered?

By François Longin and Estefania Santacreu-Vasut

Co-founders of *Gender & Finance*

Professors at ESSEC Business School

Few female CEOs

- Fact #1: Women are persistently underrepresented in CEO positions.
 - US / Europe / Asia
- Broad research question: WHY do we observe so few female CEOs over time?
- An existing answer (on the demand side of the CEO job market): **glass ceiling** related to invisible barriers for women to advance in the corporate hierarchy, and *in fine* to become CEO
 - Internal barrier *inside* the firm related to the decision-making process (boards / hiring committees) not to appoint many female CEOs
 - External barrier *outside* the firm related to the reaction of investors who can sell their stocks following the announcement of a new CEO (because of the impact of the CEO on the market value of the firm).

Negative stock market reaction

- Fact #2: Negative stock market reaction following the appointment of a female CEO as found in Lee and James (2007) and Zhang and Qu (2013)
- Our research question: WHY do we observe such a negative stock market reaction?
- This question is important because:
 - Firms may anticipate a negative stock market reaction from investors and then may be discouraged to appoint female CEOs (feedback effect).
 - Indeed, there may be a link between internal barrier (firm decision-making process) and external barrier (stock market reaction). Endogeneity issue.
- Existing answers based on the determinants of market behavior:
 - Preferences: beliefs, stereotypes and prejudice (taste-based discrimination by Becker, 1957, “think manager, think male” by Schein, 1973)
 - Information: role of media (Lee and James, 2007 and Dixon-Fowler et al., 2013)
 - Endowment

Focus of our paper: The role of preferences

- The *primitives* of the aggregate stock market reaction
 - If preferences matter, we have to look at *individuals* because preferences are at the individual level.
- Recent idea in the literature: in-group preferences
 - Homophily: “tendency for people be attracted to those who are similar to themselves.” Within the context of gender: “gender homophily”
 - Board gender composition and CEO gender (Matsa and Miller, 2011) / Start-up investors in the primary market (Snellman and Solal, 2019) / Financial analysts’ recommendation (Jannati et al., 2019)
- Focus of our research: gender homophily among investors (in the secondary stock market) related to the CEO
 - Use of experiments to study the trading reaction of male/female market participants following the appointment of a male/female CEO

Hypotheses

- Hypothesis 1: negative stereotypes against female CEOs or “Think CEO, think male” idea
 - When a *male* CEO is appointed, stock market participants *buy* stocks.
 - When a *female* CEO is appointed, stock market participants *sell* stocks.
- Hypothesis 2: gender homophily among stock market participants
 - Market participants *buy* stocks when a CEO of their *own gender* is appointed.
 - Market participants *sell* stocks when a CEO of the *opposite gender* is appointed.

Our method: simulation-based lab experiment

- Use of a realistic simulation tool SimTrade
 - Simulation of the stock market for a firm (SunCar)
 - Series of events that unfold during the day. One of the events is the appointment of the new CEO for SunCar.
- Operationalization of our theoretical construct (preference towards the appointed CEO): **revealed** preferences through the trading activity of market participants.
 - You buy if you like the CEO. You sell if you don't like the CEO.
- Randomized simulations with either a male CEO (50%) and a female CEO (50%)
 - Experiments provide better statistical results than empirical studies with always very few observations of firms led by a female CEO
- Participants
 - Students from a French business school with a balanced population of female and male students
- Consequential experiment for participants
 - Incentive: bonus for the Finance course based on their performance in the simulation (the GPA is very important to go abroad for an exchange)

Advantages of simulation-based lab experiments

- Factors influencing the stock market reaction to CEO appointments:
 - The relative past performance of the firm (overperformance/underperformance)
 - The departure type (forced /voluntary)
 - The succession type (outsider/insider)
 - The firm characteristics relevant for the appointment (composition of the board, existence of nomination committee, involvement of the departing CEO, and gender diversity with the firm).
- Neutralization of these factors in our simulation
 - Same firm in the simulations except for the gender of the CEO
 - We study a **pure gender effect** about the CEO.
 - Similar to the experiment by Adams, Kräussl, Navone and Verwijmeren (2017) to study the impact of the gender bias on pricing of art

Advantages of simulation-based lab experiments

- Informational issues:
 - The exact date of the public announcement of the CEO appointment
 - The release of other news at the time of the CEO appointment
 - The strategic communication of the firm
 - The presentation of the event by the media
 - The limited attention from investors.
- Internal validity

Relation between variables and hypotheses

Data from our experiment

- Gender of the CEO (male/female depending on the variant of the simulation)
- Gender of the participant
- Trading reaction after the news about the CEO appointment (orders sent by participants to the market)
 - Participation to the market: yes (order) / no (no order)
 - Direction of the order: buy order / sell order
 - Quantity of the order: 100 stocks for example
 - Type of order: market order / limit order
 - Date/time of the order (time lapse after the news)

Descriptive statistics

Trading reaction of male and female participants following the appointment of a male or female CEO

- What do you expect?

	Male CEO simulations	Female CEO simulations
Male participants	Buy? Sell?	Buy? Sell?
Female participants	Buy? Sell?	Buy? Sell?

Trading reaction after the appointment of a CEO

Measures

- Dependent variable (DV): the trading reaction of individuals (stock market participants) following the appointment of the CEO
- Two components of our DV:
 - Extensive margin (EM): *qualitative* measure of the trading reaction
$$EM = \text{Trading activity (order/no order)} \times \text{Direction of the order (buy/sell order)}$$
 - Intensive margin (IM): *quantitative* measure of the trading reaction
$$IM = \text{Trading activity (order/no order)} \times \text{Direction of the order (buy/sell order)} \\ \times \text{Quantity of the order} \times \text{Probability of execution} \times \text{Promptness of execution}$$

We use three measures of the strength of the market participation: the quantity of assets bought or sold (intensity), the probability of execution related to the use of market or limit orders (aggressiveness), the promptness of execution related to the time lapse between the announcement of the new CEO and the stock market order sent by the participant (reactivity).

Statistical models

- Multinomial logit model for the extensive margin (EM)
- Linear regression model for the intensive margin (IM)
 - $IM = \alpha_0 + \alpha_1 \cdot \text{Dummy}(\text{CEO Gender}) + \alpha_2 \cdot \text{Dummy}(\text{Participant Gender}) + \alpha_3 \cdot \text{Dummy}(\text{CEO Gender} \times \text{Participant Gender}) + \beta \cdot \text{Control variables} + \varepsilon$
 - Dummy = 0 if male and 1 if female
- Our hypotheses predict:
 - H1: negative stereotypes against female CEOs $\alpha_1 < 0$
 - H2: gender homophily $\alpha_3 > 0$

Regression results

Table 2. Regression results for the participants' trading reaction following the appointment of the new CEO

	Dependent variable: participants' trading reaction

H1: negative stereotypes
against female CEOs

$$H1: \alpha_1 < 0$$

H2: gender homophily

$$H2: \alpha_3 > 0$$

Economic significance: Market gender bias indicator

Our contribution (1/2)

- Our result: we find evidence of gender homophily among investors related to the gender of the CEO.
 - Male investors tend to buy (sell) stocks following the appointment of a male (female) CEO.
 - Female investors tend to buy (sell) stocks following the appointment of a female (male) CEO.
 - Differences in gender preferences between men and women (revealed in our experiment by their trading activity)
- Fact # 3: few female working in the financial industry (women represent only 16% of CFA holders for example)
- Combining our result and Fact #3: this creates a gender-biased stock market against female CEOs.

Our contribution (2/2)

- A gender-biased stock market against female CEOs (due to the differences in preferences between men and women, and the gender composition of the stock market) may explain the negative stock market reaction following the appointment of a female CEO as found in empirical studies (Fact #2).
- The stock market reaction may be a component of the glass ceiling (external barrier). The stock market reaction is also taken into account by the decision-making bodies (hiring committees and boards) in their decision to appointment or not female CEOs (endogeneity).
- This could explain the persisting underrepresentation of women in CEO positions (Fact #1).

Policy implication: our recommendations

- Gender is not only an issue at the corporate level reflected in the need to appoint more female CEOs but also an issue at the financial industry level reflected in the need **to increase its gender diversity** by attracting more women in investment occupations.
- Also an issue at the societal level reflected in the need to change **individual and collective gender stereotypes** about leadership through training programs organized by financial institutions to educate investors.

Take away

- The market is gendered!
 - Differences in gender preferences between male and female investors
- Our contribution
 - Differences in preferences between men and women resulting in gender homophily + Low female participation in the finance industry
 - ⇒ Gendered-biased stock market with implication for the CEO job market
- Reproduce the experiment in your institution to improve the externality of our results
 - Different countries, different cultures, different types of participants

Thank you!
